Elegant, flexible and secure: modern access solutions take building security to a new level

The demands placed on modern buildings are constantly increasing – and with them the requirements for access control as an indispensable component of comprehensive building security. However, the wishes of building owners, architects and integrators are very individual – both in terms of technology and design. So it's good when solutions can be integrated into any security concept as flexibly, stylishly and scalably as the universal readers in the Secustos product family from sesamsec.

The following features set new standards in access control:

#1 Flexibility:

The Secustos readers are universal devices that support almost any LF or HF RFID transponder technology and also mobile credentials that use Near-Field Communication (NFC) or Bluetooth® Low Energy (BLE). This not only allows integrators to choose between all currently used technologies, but they can also easily integrate the readers into existing concepts and thus offer future-proof solutions.

#2 Simple installation and commissioning:

Proven cable connection technology and mounting frames ensure simple installation. The design-oriented readers are among the flattest systems on the market and can be installed on the wall or in a flush-mounted box. Numerous interface options including OSDP and Wiegand guarantee seamless integration. Thanks to pre-configured settings, the innovative Seco app ensures smooth and fast installation and significantly reduces the (time) effort for installers.

#3 Stylish and robust:

The wall readers in the Secustos family have an attractive flat housing made of high-quality glass and metal in light silver and classic gray. Not only do they look good, they are also extremely robust and can withstand wind and weather. Customers can choose whether they want to use the devices with or without an integrated keypad.

#4 Secure:

Secustos offers customers the greatest possible security - both physically and in virtual space. The devices feature OSPD encryption as well as an integrated proximity sensor and a tamper switch. S

#5 Future-proof:

The Secustos system can be easily kept up to date both remotely and on site. The SecoTool makes it easy to configure and adapt the firmware, while the mobile Seco app supports quick on-site configuration via an Android device.

#6 Service-oriented:

Secustos readers are supported by a comprehensive range of professional services that facilitate installation, configuration and management. With the help of cloud-based tools for "Physical Access Control-as-a-Service" (PACaaS) or its partner portal, sesamsec offers unparalleled partner support to ensure a smooth implementation of the access solution.

As an innovative access control solution, Secustos combines maximum security, flexibility and user-friendliness to meet the unique requirements of each customer with a customized and scalable system. And thus provides the optimal answer to the increasing demands placed on modern buildings in the digital transformation.
